The length (k) of the normal to an ellipse, from the curve to the point where it meets the minor axis, is e (or $a : c$) times the distance of this point from the focus. This can be readily proved from Taylor's Conies, p. 60, or Salmon's Conies, p. 164. Moreover the fixed point P is obviously one of the two points inverse to each other with respect to both circles, and may, from this property, be easily determined. See Tolvnsend's Modern Geometry, Art. 188, Cor. 1 and 2; Art. 155, Cor. 2--Editob. 1519 (Proposed by F. D. Thomson, M.A.)--ABC is a triangle having the three real points (P, Q, R) of inflexion of a cubic on the sides BC, CA, AB respectively, each of which also passes through two imaginary points of inflexion. The tangents at Q and R meet in I , those at R and P in E , and those at P and Q in F . Show that AD, BE, CF meet in a point which is fixed for all the cubics having the same nine points of inflexion. I. Solution by Professor Cremona, of Bologna. The connectors AD, BE, CF are concurrent, since, by construction, ABC and DEF are coaxial triangles. Further, these connectors are the respective harmonic polars (see Salmon's Higher Plane Curves, p. 140, or Cremona's Teoria Geometrica delle Curve Piane, p. 113) of $P, Q, R, \dots$
